Programming Topics

- Variables
- Operators
- Conditionals
- Loops
- Arrays
- Functions
- Program Flow

Review: math. operators

```
js
```

```
let a = 10;
let b = 6;
let result;
result = a + b;
result = a - b;
result = a * b;
result = a / b;
result = a % b;
```

```
addition result = 16
subtraction result = 4
multiplication result = 60
division result = 1.6667
modulo result = 4*
```

*Remainder of integer division

Review: assignment operators

```
let r;
r = 10;
r = r + 1;
r += 2;
r = 2;
r *= 2;
r /= 2;
r %= 2;
```

```
assignment \mathbf{r}=11 (10+1) add. assignment \mathbf{r}=13 (11+2) sub. assignment \mathbf{r}=11 (13-2) mul. assignment \mathbf{r}=22 (11*2) div. assignment \mathbf{r}=11 (22/2) mod. assignment \mathbf{r}=1 (11%2)^*
```

*Remainder of integer division

Review: other operators

Review: if else

```
if (x == 200) {
   // Do something
else if (x < 200) {
    // Do something
else {
    // Do something else
```

Only <u>ONE</u> block of code will be executed.

Review: relational operators

```
if (x >= 200) {
    // Do something
}
else {
    // Do something else
}
```

operators	meaning
>	larger than
<	smaller than
>=	larger or equal to
<=	small or equal to
!=	not equal to
==	equal to

Modulo Operator '%'

modulo operator '%' computes the remainder of an integer division. Example:
 5 % 2 returns 1.

• This operator is particularly useful for some simple looping operation.

Modulo Operator '%'

```
EDIT ON
                                                   Result
                                                                                     CODEPEN
let num = 0;
function setup(){
  createCanvas(200,200);
  fill(128);
function draw() {
  let brightness = num % 256;
  background(brightness);
                                                      0.5× 0.25×
Resources
                                                                                              Rerun
```

Once you have saved your sketch, you may download the sketch as a zipped archive.

Logical Operators

Logical operators

- logical operator helps us to compose more flexible 'conditions' for various JavaScript conditionals.
- All 'conditions' evaluation in JavaScript returns a logical (boolean) value 'true' or 'false'.

```
if (x == 200) {
    // Do something
}
```

Simple SINGLE condition, what if we want to combine two or more conditions?

js

Logical operators

operators	meaning
Ш	Logical OR
&&	Logical AND
· !	Logical NOT

```
if (x == 0 || x == 200 ) {
    // Do something
}
```

This block will run only if

X equals to 0

OR

X equals to 200

js

Logical operators

operators	meaning
Ш	Logical OR
&&	Logical AND
· !	Logical NOT

```
if (x > 1 && x != 200) {
    // Do something
}
```

This block will run only if

X is larger than 1

AND

X is not equal to 200

Logical operators

operators	meaning
- 11	Logical OR
&&	Logical AND
!	Logical NOT

```
if (!(x > 1)) {
    // Do something
}
```

The NOT operator always inverses the result of the condition (x > 1). So the block runs when x does not fulfill (x > 1), i.e. the block runs when x is NOT larger than 1.

Truth table

Logical OR ' | | '

A	В	(A B)
true	true	true
true	false	true
false	true	true
false	false	false

Logical AND '&&'

Α	В	(A && B)
true	true	true
true	false	false
false	true false	
false	false	false

Logical NOT '!'

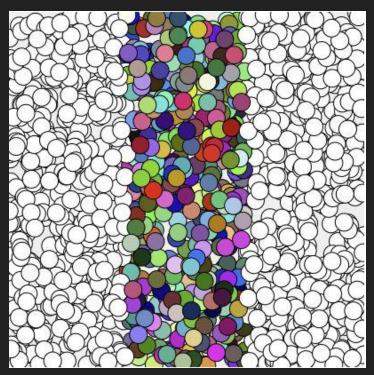

A	! (A)
true	false
false	true

In-class exercise 2

- 1. Fill the canvas (400 x 400) with circles of size 20, each with a random position.
- 2. Divide the screen into 3 regions as shown in the figure. Circles in the middle region are randomly colored, and the rest are in white.
- 3. Use <u>only one conditional</u>. Hint: Use a 'logical operator'.

```
function setup() {
 createCanvas(400, 400);
 background(220);
function draw() {
   fill(150);
   fill(0);
 ellipse(50 * x, 0, 50, 200);
```

It is VERY IMPORTANT to use proper indentation and spacing in your code.

WHY?

- Easier for you to read
- Easier for others to read
- Help you to spot mistakes
- It shows you understand the craft of coding

```

       function setup(){
         createCanvas(200,200);
         fill(128);
    8 function draw() {
          // Loop thru 0 - 256 for color
         let brightness = num % 256;
   10
         background(brightness);
   12
         // Loop thru 0 - 200 for position
         stroke(256 - brightness);
   14
         let xv = num % 200;
   16
         rect(xy, xy, 20, 20);
   18
         num++; // increment by 1
   19
```

p5.js editor also offers convenient code formatting functions.

Properly formatted code is required in all assignments.

Poorly formatted code will lead to point deduction.

• A 'Loop' allows a block of code to be executed repeatedly (a.k.a. iteration).

 A while() loop repeats a block of code to as long as certain condition is fulfilled in each iteration.

The simple while () loop below repeats drawing a rectangle as long as the value of variable x is less than 3.

```
let x = 0;
while ( x < 3 ) {
   rect( x, 0, 10, 10);
   x = x + 1;
}</pre>
```

```
while ( <condition> ) {
   // code run multiple times;
}
```

while () loop <u>repeats the</u> <u>block of code</u> as long as the condition <u>is being fulfilled</u>, i.e. the <u>condition is verified</u> in each iteration.

```
if ( <condition> ) {
   // code run ONCE only;
}
```

if () runs the block of code if the condition is fulfilled and it only runs once.

It is VERY IMPORTANT to note that the block of code inside a while () loop should always do something to fail the condition by design.

```
let x = 0;
while ( x < 3 ) {
    rect( x, 0, 10, 10);
    // x = x + 1;
}</pre>
```

INFINITE LOOP It never stops!!

```
while (x < 10) {
   // some code here;
}</pre>
```

The <condition> is written in similar fashion as in if-else and other conditionals.

```
while (x != 10 && y == 1) {
   // some code here;
}
```

Try the following code inside function setup() of a sketch using the p5.js editor

```
let x = 5;
while (x > 0) {
   text(x, x * 12, 20);
   x--;
}
```

```
let y = 0;
while (y < 5) {
   text(y, 20, y * 12);
   y++;
}</pre>
```

text() drawing and mouseIsPressed

text() drawing

- text("hi",x,y) draws numbers or text at a given coordinate on the canvas.
- textSize(size) defines the size of text to be drawn.
- Colors of the text to be drawn, like most shapes are controlled by fill() and stroke().

text() drawing

- loadFont (URL) loads a font file from the given URL or a local file. loadFont (URL) should be called within the function preload() block of p5.js.
- textFont (font) tells P5.js what font to be used for the text to be drawn by text()

Built-in variable mouseIsPressed

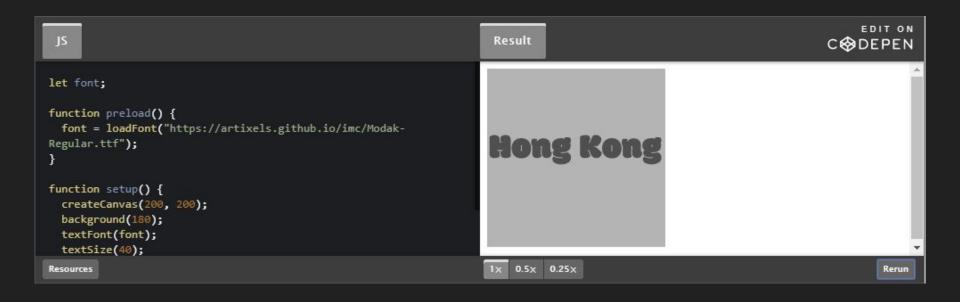

mouseIsPressed is a p5.js built-in boolean variable (stores true or false) that you may use for detecting if the mouse is being pressed. Use it with a if() {} statement and execute your desired instructions when the mouse is pressed. (use it in function draw() block)

```
if (mouseIsPressed) {
    // Draw or Do something
}
```

text() and mouseIsPressed

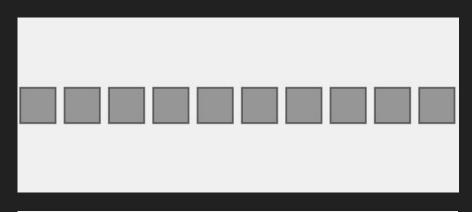

In-class exercise 3

1. Add your code to function setup(), not function draw(). Use a while() loop to draw 10 gray squares across a 500 x 200 canvas, exactly as shown.

2. Add the numbers as shown to your squares.

In-class exercise 4

Try your best to reproduce the following 4 drawings as close as possible using while() loop. The left 3 should only take one single while() loop, and the right-most one may take more than one loop.

Assignment #1 has been released on our Canvas page this Monday (Sept. 16).

Please study the specification carefully

Due Date Next Friday (Sep 27) 23:59.
